Inventory Module — Recovery Batch and Source Document Feature

Description

The Inventory Module of the FCDC Integrated Accounting Information System will be enhanced to identify the source category of recovered or salvaged construction materials and provide access to supporting documents for rework expenses.

The feature will be integrated into the existing **Manage Inventory** section. Each applicable inventory item will display its assigned recovery batch, allowing users to identify whether the material belongs to the Steel Bars, Yero, or Electrical Materials category.

Each batch or associated material record will provide access to its source documents, particularly the receipts for rework of salvaged materials intended for resale. These documents will serve as supporting evidence for the recorded materials and related rework expenditures.

Required Information

1. Recovery Batch Categories

- Batch 1 — Steel Bars of different sizes
- Batch 2 — Yero of different sizes
- Batch 3 — Recovered Electrical Materials

2. Manage Inventory

- Display the assigned batch for each applicable recovered-material inventory item.
- Replace the displayed “Life Cycle” label with “Batch,” subject to checking its existing function.
- Allow users to open the corresponding batch details.

3. Source Documents

- Provide a clickable Source Document or View Receipt option.
- Display the actual uploaded rework receipt or supporting document.
- Allow multiple receipts where applicable.
- Clearly indicate when no document is available.

4. Document Information

- Receipt or reference number, if available
- Receipt date
- Rework description
- Rework amount
- Uploaded receipt or supporting file

5. Data Management

- Batch assignments and document references must be saved in the database.
- Preserve existing inventory records and functionality.
- Do not automatically change inventory valuation or post accounting entries based solely on an uploaded receipt.

Expected Result

The Manage Inventory section will allow authorized users to identify the recovery batch of each applicable material and access its supporting source documents. This will improve inventory traceability and provide documentary evidence for recovered materials and their rework expenses.

DEVELOPMENT TASK: FCDC VAT COMPLIANCE MODULE

Internal VAT Records, Input/Output VAT, Automated Summary, and Internal BIR Form 2550Q Worksheet

1. Project Context

We are developing the **Integrated Accounting Information System with Point-of-Sale (POS) and Tax Record Management for Fabellon Construction and Development Corporation (FCDC)**.

FCDC is VAT-registered. The existing Laravel-based system already has a Tax Compliance section containing VAT Records, VAT Summary, Tax Report, and VAT Return Preparation.

We want to rename the visible **Tax Compliance** section to **VAT Compliance** and focus its functionality on internal VAT monitoring and reporting.

This is an enhancement to the existing system, not a request to rebuild the application.

2. Objective

Implement a focused VAT Compliance Module that:

- Records applicable Input VAT and Output VAT.
- Retrieves relevant information from existing sales and purchase records.
- Automatically consolidates VAT figures for a selected reporting period.
- Generates an internal VAT return worksheet patterned after the applicable official BIR Form 2550Q.
- Allows users to review, print, or export the internal worksheet, using existing project capabilities where available.
- Maintains traceability between reported figures and the underlying transactions.

Internal use only: The system must not represent the generated worksheet as an officially filed tax return. Direct BIR submission and tax payment are outside this task's scope.

3. Navigation and Existing Pages

Rename the existing sidebar label from “Tax Compliance” to **“VAT Compliance,”** subject to checking existing route and permission dependencies.

Retain and adapt the existing pages where possible. The approved visible submodules are:

1. **VAT Records** — records of applicable Input VAT and Output VAT transactions.
2. **VAT Summary** — consolidated VAT figures for the selected reporting period.
3. **VAT Report** — detailed and summarized VAT information for internal review and reporting.
4. **Internal VAT Return Worksheet** — an automatically populated internal worksheet patterned after the applicable BIR Form 2550Q.

Rename the existing “Tax Report” page label to “VAT Report.” Rename the existing “VAT Return Preparation” page label to “Internal VAT Return Worksheet.”

Reuse the existing pages and functionality wherever possible instead of creating duplicate modules. Inspect route names, permissions, and dependencies before changing labels or routes.

The VAT Report must focus exclusively on VAT-related information within the approved scope. Do not introduce a general Tax Report covering other tax types.

The Internal VAT Return Worksheet must clearly display:

“FOR INTERNAL USE ONLY — NOT AN OFFICIAL BIR FILING.”

Do not create unnecessary sidebar modules or change unrelated accounting functionality.

4. Input VAT Records

The system should support recording and reviewing purchase transactions that may qualify for Input VAT.

Where available, record:

- Transaction date.
- Supplier name.
- Supplier invoice/reference number.
- Purchase description.
- Purchase classification.
- Amount before VAT.
- VAT amount.
- Total amount.
- Source transaction reference.
- Supporting document reference or attachment.
- Validation or review status.

Use actual purchase records and approved transaction sources where these already exist.

Do not automatically treat every purchase, rework receipt, supplier payment, or expense as allowable Input VAT. The transaction must be evaluated according to the applicable VAT rules and approved accounting policy.

Do not duplicate a purchase record already imported from another module.

5. Output VAT Records

The system should support recording and reviewing applicable VAT-related sales.

Where available, record:

- Transaction date.
- POS sales or invoice reference.
- Customer information, where required and available.
- Sales classification.
- Amount before VAT.
- Output VAT amount.
- Total amount.
- Source transaction reference.
- Validation or review status.

Reuse the existing POS transaction as the source of truth when a valid integration already exists.

Do not invent sales figures or use demonstration sales as production VAT records.

6. VAT Summary

Implement or improve the VAT Summary so users can select a reporting period, particularly a quarter.

The summary should consolidate the applicable source records and display relevant figures, including:

- Applicable sales totals.
- Output VAT.
- Eligible Input VAT.
- Relevant adjustments, where supported and approved.
- Other totals required by the approved internal worksheet.
- Computed VAT payable or excess credit, where applicable under the approved rules.
- Record counts and review status.

The figures must be traceable to the underlying records.

Avoid double counting, duplicate imports, and mixing transactions from different periods.

Do not hardcode sample amounts or assume that every transaction is subject to the same VAT treatment.

7. Internal VAT Return Worksheet

Create or enhance the existing VAT Return Preparation page to generate an internal worksheet patterned after the applicable BIR Form 2550Q.

Requirements:

- Allow the user to select the reporting quarter and year.
- Automatically populate the applicable fields from validated VAT records and approved computations.
- Map source totals to the appropriate form fields.
- Identify any required data that are missing, incomplete, or awaiting review.
- Allow users to review the populated values before printing or exporting.
- Display the selected reporting period and the preparation/review status.
- Clearly label the output **"FOR INTERNAL USE ONLY — NOT AN OFFICIAL BIR FILING."**

Use the applicable official BIR Form 2550Q and its instructions as the reference for field mapping. Confirm the appropriate form version and applicability before implementing the mapping.

Do not simply copy a form layout without verifying how each field is populated.

Do not claim that the worksheet has been filed, submitted, or accepted by the BIR.

8. VAT Classification, Computation, and Validation

The system must classify transactions according to their applicable VAT treatment under current BIR rules and the approved accounting requirements of FCDC.

8.1 VAT Transaction Classifications

The system must support the following classifications, where applicable:

1. **VATable Transactions**
2. **VAT-Exempt Transactions**

3. **Zero-Rated Transactions**
4. **Other VAT classifications or treatments**, if applicable under current BIR rules and approved for FCDC.

The system must not treat these classifications as interchangeable. Each classification must follow its applicable VAT computation, recording, reporting, and validation rules.

8.2 Classification Rules and Validation

- A transaction must not automatically be classified as zero-rated simply because no VAT was charged or collected.
- The selected classification must be supported by the applicable VAT rules and required supporting information or documentation.
- The system must not assume that all sales, purchases, or expenses receive identical VAT treatment.
- Input VAT eligibility must be evaluated separately from the VAT classification of the purchase. Not every purchase or expense automatically qualifies for allowable Input VAT.
- Where the required classification, supporting information, or validation is missing, the system must flag the transaction for review instead of silently assigning an unsupported classification.
- Any user changes to a VAT classification must follow the system's authorization and audit-trail controls, where supported.

8.3 VAT Computation

- Inspect the existing VAT calculation logic before modifying it.
- Apply the approved VAT treatment and applicable rate to each validated transaction.
- Verify any fixed 12% VAT assumption before applying it to all transaction categories.
- Use appropriate precision and rounding rules consistent with the approved requirements.
- Ensure that VAT totals reconcile with the underlying source records and the selected reporting period.
- Do not silently overwrite validated values or fabricate missing data.

8.4 Reporting and Integration

- Reflect the applicable VAT classifications in VAT Records, VAT Summary, VAT Report, and the Internal VAT Return Worksheet, as relevant to each page.
- Map classified transactions to the appropriate fields of the applicable BIR Form 2550Q reference only after verifying the official form and instructions.
- Preserve traceability between each reported amount, its classification, its source transaction, and its supporting documentation where available.
- Do not include unverified or unsupported classifications in finalized computations without clearly identifying their review status.

All classification rules, exceptions, and form-field mappings must be verified against applicable current BIR rules and approved by the designated accounting reviewer or CPA before implementation.

9. Integration Requirements

The intended workflow is:

POS or applicable sales source → Output VAT Records → VAT Summary → Internal VAT Return Worksheet

Applicable purchase records → Input VAT Records → VAT Summary → Internal VAT Return Worksheet

Where a source module is not yet functional or integrated, identify the limitation and report it. Do not simulate an integration by inserting hardcoded data.

Maintain consistent transaction references and avoid duplicate records.

Do not change inventory valuation, journal entries, General Ledger, Trial Balance, Financial Statements, or other accounting workflows as part of this task unless a necessary dependency is identified and separately approved.

10. Database, Security, and Permissions

Inspect the current schema, models, migrations, routes, controllers, permissions, and existing VAT services before editing.

Reuse existing data structures and relationships wherever possible.

Any required migration must preserve existing records. Do not reset the database, truncate tables, delete VAT history, or modify production data without explicit authorization.

Follow existing authentication and authorization conventions. Protect sensitive supplier, customer, transaction, and document information.

Maintain appropriate traceability for records and changes, consistent with the existing application design.

11. Testing and Acceptance Criteria

Test and report actual results for the following:

1. The sidebar displays “VAT Compliance” without breaking navigation or permissions.
2. Existing VAT pages open and use the intended source data.
3. Input VAT records can be traced to their source purchase records and supporting documents where available.
4. Output VAT records can be traced to the corresponding sales records.
5. The VAT Summary reflects the selected period and the underlying eligible records.
6. Duplicate source transactions are not counted twice.
7. The internal worksheet populates the correct mapped fields from validated records.
8. Missing or unverified information is clearly identified.
9. The printed or exported worksheet carries the internal-use-only notice.
10. Existing POS, inventory, and accounting functions remain intact.
11. Relevant existing automated tests and new feature tests run successfully.

Do not claim that a test passed unless it was actually executed and passed.

12. Required Implementation Process

Stage A — Inspect: Identify the existing routes, pages, database tables, models, services, calculations, permissions, and source integrations. Distinguish functional records from demonstration data.

Stage B — Report: Describe the current implementation, missing functionality, dependencies, proposed files to change, and any assumptions requiring approval.

Stage C — Implement: Make only the approved changes. Preserve existing records and working features. Avoid unrelated refactoring.

Stage D — Verify: Run applicable tests and report actual results, remaining limitations, and manual verification steps.

13. Final Report

After implementation, provide:

- Existing functionality found.
- Features implemented.
- Files changed and their purposes.
- Database migrations, if any.

- Source integrations used.
- VAT calculation and form-mapping rules implemented.
- Tests executed and actual results.
- Remaining limitations or items requiring accounting/professor approval.

Priority: accurate internal reporting, traceable source data, data preservation, minimal scope, and compatibility with the existing FCDC system.

FCDC AIS — OVERALL ACCOUNTING MODULE REQUIREMENTS AND IMPLEMENTATION SPECIFICATION

1. Project Context

The existing system is a Laravel-based Accounting Information System (AIS) for Fabellon Construction and Development Corporation (FCDC).

FCDC is involved in demolition/construction operations and the sale of recovered or second-hand construction materials.

The system includes or is intended to include POS, Inventory, VAT Compliance, Accounts Payable, Cash Disbursements, and Accounting functions.

The Accounting Module must be integrated with the existing system and must support actual accounting transactions, accurate balances, traceable postings, and reliable financial reports.

Important: Enhance the existing system. Do not rebuild it from scratch, duplicate existing modules, or remove working functionality without approval.

Additional Project Decisions

- FCDC is a corporation. The Accounting Module must use corporation-appropriate equity accounts, subject to validation against the company's corporate records and professor/CPA guidance.
- Illustrative opening balances may be used for capstone demonstration and testing. These figures must be clearly labeled as "Illustrative / Sample Data — Not Actual FCDC Financial Records."
- The system must support a designated authorized approver for Journal Entries and Adjusting Entries, with appropriate permissions and an audit trail.
- These decisions must be implemented within the existing Laravel AIS without rebuilding the system or disrupting working functionality.

2. Accounting Module Scope

The Accounting Module shall consist of the following:

1. Chart of Accounts (COA)
2. Journal Entry
3. General Ledger
4. Trial Balance — Unadjusted and Adjusted
5. Financial Statements
6. Notes to Financial Statements / Disclosure

Accounts Payable and Cash Disbursements remain related transaction modules that must integrate with the accounting workflow where applicable.

3. Overall Accounting Workflow

The intended workflow is:

Source Transactions → Accounting Posting/Journal Entries → General Ledger → Unadjusted Trial Balance → Approved Adjusting Entries → Adjusted Trial Balance → Financial Statements → Notes to Financial Statements.

Applicable source transactions include:

- POS sales
- Inventory-related transactions, including approved inventory adjustments
- Supplier credit purchases through Accounts Payable
- Cash Disbursements
- Applicable VAT-related transactions
- Other approved business transactions

Every transaction must be recorded according to its actual accounting nature and approved account mapping.

Automatically generated accounting entries must not be duplicated by manually recording the same transaction.

4. Chart of Accounts (COA)

Configure a practical Chart of Accounts suitable for FCDC's actual operations.

The following is a proposed account list for professor/CPA validation. Reuse existing valid accounts and inspect current source-account mappings before adding or activating accounts.

A. Assets — 1000 Series

Code	Account Name
1010	Cash on Hand
1020	Cash in Bank
1030	Accounts Receivable
1040	Input VAT
1050	Inventory — Recovered Construction Materials
1060	Inventory — Other Resale Materials
1070	Prepaid Expenses
1080	Advances to Employees/Suppliers
1500	Property and Equipment
1510	Accumulated Depreciation

B. Liabilities — 2000 Series

Code	Account Name
2010	Accounts Payable

2020	Accrued Expenses Payable
2030	Output VAT
2040	VAT Payable
2050	Salaries and Wages Payable
2060	Other Taxes Payable, if applicable
2070	Customer Advances, if applicable
2080	Loans Payable, if applicable

C. Equity — 3000 Series

Since FCDC is a corporation, use the following proposed corporation-appropriate equity accounts, subject to professor/CPA validation:

Code	Account Name	Account Type	Normal Balance
3010	Capital Stock	Equity	Credit
3020	Additional Paid-in Capital, if applicable	Equity	Credit
3030	Retained Earnings	Equity	Credit
3040	Current-Year Profit or Loss	Equity	Credit when there is a profit; Debit when there is a loss
3050	Dividends Declared, if applicable	Contra-Equity	Debit

Use only accounts applicable to FCDC's confirmed corporate records and approved accounting policies.

The proposed COA must include account codes, account names, account types, normal balances, and other necessary configuration fields. Inspect existing accounts and source-account mappings before adding or activating accounts. Reuse valid existing accounts and prevent duplicate account codes.

The complete proposed COA must be reviewed against FCDC's actual operations and validated by the professor/CPA before production posting is enabled.

D. Revenue — 4000 Series

Code	Account Name

4010	Sales — Recovered Construction Materials
4020	Sales — Other Materials
4030	Demolition Service Revenue, if applicable
4040	Other Operating Revenue
4090	Sales Returns and Allowances

E. Cost of Goods Sold — 5000 Series

Code	Account Name
5010	Cost of Goods Sold — Recovered Materials
5020	Cost of Goods Sold — Other Materials
5030	Approved Rework Costs Included in Inventory Cost, if applicable
5090	Inventory Adjustments / Shrinkage, subject to approval

The CPA must determine the appropriate treatment of rework costs and inventory adjustments. Do not automatically expense all rework costs or capitalize them without an approved accounting policy.

F. Operating Expenses — 6000 Series

Code	Account Name
6010	Salaries and Wages Expense
6020	Rent Expense
6030	Utilities Expense
6040	Transportation and Delivery Expense
6050	Repairs and Maintenance Expense
6060	Fuel and Lubricants Expense
6070	Tools and Supplies Expense
6080	Equipment Maintenance Expense
6090	Communication and Internet Expense
6100	Office Supplies Expense
6110	Depreciation Expense
6120	Permits and Licenses Expense
6130	Professional Fees
6140	Bank Charges
6150	Insurance Expense
6160	Other Taxes and Fees Expense, as applicable

6190	Miscellaneous Expense

G. Other Income and Expenses — 7000 Series

Code	Account Name
7010	Other Income
7020	Interest Income
7030	Interest Expense
7040	Loss on Disposal of Equipment, if applicable
7090	Other Non-Operating Expenses

These accounts are proposed and must be adjusted to the actual transactions, accounting policies, and approved COA of FCDC.

Miscellaneous Expense Rules

Miscellaneous Expense is intended for legitimate, incidental business expenses that do not reasonably fit an existing expense account.

- Require a clear transaction description and appropriate supporting reference or documentation.
- Require authorized review where applicable.
- Do not use Miscellaneous Expense as a default for unidentified transactions, missing documentation, inventory losses, equipment purchases, or significant unusual expenses.
- If an existing specific account is appropriate, use that account instead.
- Do not automatically post unmapped transactions to Miscellaneous Expense.

5. Journal Entry Module

The Journal Entry module must support manual entries and approved adjusting entries.

Required fields

- Entry number
- Transaction date
- Accounting period
- Source/reference number
- Account code and account name
- Debit amount
- Credit amount
- Explanation or narration
- Prepared by
- Reviewed/approved by, where applicable
- Status: Draft, Pending Review, Approved, Posted, or Reversed, as supported by the approved workflow

Required functions and controls

1. Allow multiple account lines in one journal entry.
2. Validate that total debits equal total credits before posting.
3. Permit only valid, active COA accounts.
4. Prevent draft or unapproved entries from affecting posted balances.
5. Maintain source references and an audit trail.
6. Prevent unauthorized editing or deletion of posted entries.
7. Use approved reversal or adjustment entries to correct posted transactions.
8. Prevent duplicate entries for transactions already posted automatically by source modules.

Authorized Approval and Posting Controls

The designated authorized approver for the capstone system shall be the assigned user configured by the system administrator. This user may review, approve, and post Journal Entries and Adjusting Entries according to the assigned permissions.

Requirements:

1. Restrict approval and posting actions to the designated authorized user or other explicitly authorized roles.
2. Record who prepared, reviewed, approved, posted, or reversed each entry, together with the relevant timestamps.
3. Maintain an audit trail of approval and posting actions.
4. Prevent unauthorized users from approving or posting entries.
5. Ensure that Draft, Pending Review, and other unapproved entries do not affect posted accounting balances.
6. Allow corrections to posted entries only through the approved reversal or adjustment workflow.

Do not assign permissions based solely on a displayed username or hide buttons without enforcing authorization on the server side.

6. General Ledger Module

The General Ledger must display posted accounting transactions organized by account.

Required information

- Account code and account name
- Beginning balance
- Transaction date
- Journal entry or source reference
- Transaction description
- Debit and credit
- Running balance
- Ending balance
- Selected reporting period

The General Ledger must include the accounts approved for FCDC, such as Cash, Accounts Payable, Inventory, Revenue, Cost of Goods Sold, Operating Expenses, and applicable VAT accounts.

Cash Disbursements, Accounts Payable, POS, and other approved source modules must update the relevant GL accounts through controlled posting processes.

Do not create duplicate entries when a transaction is processed by more than one related module.

7. Trial Balance Module

The Trial Balance must support:

A. Unadjusted Trial Balance

Shows account balances before approved adjusting entries.

B. Adjusting Entries

Records approved period-end adjustments with references, explanations, and appropriate authorization.

C. Adjusted Trial Balance

Shows balances after approved adjustments and serves as the accounting basis for Financial Statements.

Required information

- Account code and name
- Beginning debit/credit balance, where applicable
- Current-period debit/credit movements
- Ending balance
- Adjustments
- Adjusted balance
- Total debits
- Total credits
- Difference or out-of-balance amount

The system must show whether the Trial Balance is balanced. The difference should be zero, subject to defined rounding rules.

Beginning balances must come from verified opening balances or prior-period closing balances. Do not create arbitrary beginning balances or duplicate carried-forward balances.

The system must distinguish an Unadjusted Trial Balance from an Adjusted Trial Balance.

Illustrative Opening Balances for Capstone Testing

The system may use illustrative opening balances to demonstrate and test the accounting cycle.

Requirements:

1. Clearly label all illustrative balances as "Illustrative / Sample Data — Not Actual FCDC Financial Records."
2. Ensure that total opening debits equal total opening credits.
3. Store opening balances as controlled accounting records rather than hardcoding figures directly into report pages.
4. Use the approved COA and ensure that each opening balance is assigned to the correct account.
5. Ensure that the General Ledger, Trial Balance, and Financial Statements derive consistent figures from the same sample accounting records.
6. Prevent opening balances from being duplicated when prior-period balances are carried forward.
7. Clearly identify the reporting period and distinguish opening balances from current-period transactions.

Sample balances must remain separate from actual company transactions and must not be represented as verified FCDC financial balances.

8. Financial Statements Module

The Financial Statements module must use approved accounting balances, with the Adjusted Trial Balance as the reporting basis.

Provide the following reports:

A. Income Statement

- Revenue
- Cost of Goods Sold, where applicable
- Gross profit
- Operating expenses
- Other income and expenses, where applicable
- Net income or loss

B. Balance Sheet

- Assets
- Liabilities
- Equity

Required functions

1. Allow the user to select the reporting period or date.
2. Generate amounts from actual approved accounting records.
3. Use consistent and approved account classifications.
4. Support printing/export where required.
5. Allow traceability from statement amounts to the relevant account balances.
6. Verify the accounting equation: Assets = Liabilities + Equity.
7. Do not use hardcoded sample figures in production reports.
8. Clearly identify incomplete or unavailable source data instead of silently displaying misleading results.

9. Notes to Financial Statements / Disclosure Module

Use the approved approach: **automatically generated financial figures with manual review and editing of explanatory notes.**

A. Automatically generated figures

Where supported by the accounting records, retrieve the relevant balances and figures from the approved General Ledger and Adjusted Trial Balance.

Examples include:

- Cash and bank balances
- Accounts Receivable, if applicable
- Inventory balances
- Accounts Payable
- Revenue and other material account balances
- Other figures required by the approved disclosure template

B. Manually reviewed explanatory notes

Allow authorized users to enter or edit qualitative explanations and other information that cannot be reliably derived from balances alone.

Examples may include:

- Significant accounting policies
- Inventory valuation policy
- Explanation of material balances or changes
- Other disclosures approved by the professor/CPA

C. Controls

1. Clearly distinguish generated financial figures from manually maintained explanatory text.
2. Identify the reporting period and source of generated amounts.
3. Provide appropriate review/approval status and audit information.
4. Prevent unauthorized changes to finalized disclosures.
5. Allow printing/export with the corresponding Financial Statements.
6. Obtain CPA/professor approval of the disclosure template and applicable accounting policies.
7. Do not claim that statements are audited or CPA-certified unless this status has been established.

10. Integration Requirements

Use controlled, traceable posting from the existing modules.

- POS: approved sales transactions and their corresponding accounting effects.
- Inventory: approved inventory transactions and applicable cost-of-goods-sold or adjustment entries.
- Accounts Payable: validated supplier credit purchases and payable balances.
- Cash Disbursements: approved payments and reductions of the appropriate accounts.
- VAT Compliance: applicable VAT accounting entries, subject to the approved accounting treatment.

- Journal Entry: manual and adjusting entries not already recorded through an automated source workflow.

Every posted entry must have a traceable source or valid journal entry reference.

Do not assume that all integrations are already functional. Inspect and test each connection.

11. Data Integrity, Security, and Audit Trail

- Inspect existing tables, models, migrations, routes, controllers, services, permissions, and posting logic before changes.
- Reuse existing valid data structures where possible.
- Preserve historical transactions and existing working functionality.
- Do not reset, truncate, delete, or overwrite existing business records without authorization.
- Validate source-account mappings before enabling automatic posting.
- Restrict approval, posting, reversal, and finalization functions to authorized users.
- Maintain an audit trail for material accounting actions.
- Avoid duplicate posting, invalid account selection, and unapproved changes to posted transactions.
- Do not silently substitute demo data when actual data is missing.

12. Implementation Plan

Stage A — Inspect

Review existing accounting modules and identify what is functional, incomplete, disconnected, or still using demo data.

Stage B — Report

Provide an assessment of the COA, source-account mappings, opening balances, posting logic, trial balance, Financial Statements, and disclosure requirements.

Stage C — Implement

Make only approved changes. Reuse existing pages, database structures, and working components wherever possible.

Stage D — Test

Test the complete workflow with controlled transactions and verify the resulting balances and reports.

Do not claim successful implementation until the relevant functionality has been tested.

13. Acceptance Tests

Verify that:

1. Valid journal entries cannot be posted unless debits equal credits.
2. Draft and unapproved entries do not affect posted balances.
3. Posted entries flow correctly to the General Ledger.
4. Each source transaction is posted only once.
5. Beginning balances and period movements produce the correct ending balances.
6. Unadjusted and Adjusted Trial Balances are distinguishable and correctly calculated.
7. Financial Statements are derived from the approved Adjusted Trial Balance.
8. Assets equal Liabilities plus Equity, subject to correct accounting treatment.
9. Notes use the correct reporting period and approved source figures.
10. Manually edited explanatory notes remain distinguishable from generated figures.
11. Miscellaneous Expense is available without becoming a default account for unidentified transactions.
12. Permissions, audit trails, printing/export, and source traceability work as intended.
13. Existing POS, Inventory, VAT Compliance, and other working functions remain intact.

14. Required Implementation Report

After implementation, provide:

- Functionality verified before changes
- Features implemented or corrected
- Files and database changes made
- COA records added, reused, or mapped
- Source modules integrated
- Tests actually executed and their results
- Outstanding blockers and items requiring professor/CPA approval

Do not report a feature as complete solely because a page, button, or code component exists.

Demo/Sample Mode and Data Separation

Provide a clearly identifiable Demo/Sample Mode or an equivalent controlled mechanism for capstone testing.

Requirements:

1. Display the label "Illustrative / Sample Data — Not Actual FCDC Financial Records" wherever sample opening balances or sample-generated financial figures are presented.
2. Keep sample opening balances and sample transactions logically separated from actual business transaction records.
3. Do not automatically treat illustrative opening balances as actual company balances.
4. Prevent sample transactions from being included in actual financial reports or actual tax-compliance records.
5. Do not post sample opening balances into production records without explicit authorization.
6. Do not overwrite, reset, or delete existing business records to introduce sample data.
7. If separate demo and production environments are used, enforce the separation through the appropriate database or environment configuration rather than relying only on interface labels.
8. Clearly identify whether each report is based on sample data, actual recorded transactions, or a combination that has been explicitly authorized and disclosed.

Do not claim that illustrative figures represent actual FCDC financial records, official tax filings, audited statements, or CPA-certified reports.
